## 1. Introduction

### 1.1. ‘Quetta’?

‘Quetta’ (ᑭᑭ) means ‘word’ in Quenya [1], one of the fictional languages invented by British writer and philologist J. R. R. Tolkien. It thus seemed fitting for a module aimed at making the process of typing these languages easier.

Words are also, loosely speaking, the base units this module works on, as we shall see in more details below. While its general philosophy is to map each symbol used in Tolkien’s elvish languages to letters from the Latin alphabet, a few word-wise substitution rules were implemented so that, in *most* (but probably not all) cases the correct spelling can be obtained by typing the word phonetically. For the same reason, the mapping generally works on groups of letters when there is no natural one-to-one mapping between individual symbols.

### 1.2. The Tengwar script

A proper introduction to Tengwar is way beyond the scope of this document. We refer interested readers to Appendix E of Reference [2] and online references such as [Wikipedia.tolkiengateway.net](http://Wikipedia.tolkiengateway.net), [omniglot.com](http://omniglot.com), or [tecendil.com](http://tecendil.com).

In short, Tengwar (ᑭᑭᑭ in Quenya mode) is one of the scripts invented by Tolkien, primarily consisting of 36 letters (called *tengwar*; singular: *tengwa* (ᑭᑭᑭ)) and diacritics (*tehtar* (ᑭᑭᑭᑭ singular: *tehta* (ᑭᑭᑭᑭ))). There are several ways to relate tengwar to sounds, called *modes*. This module primarily focuses on the Quenya (ᑭᑭ), or ‘classical’, mode, in universe the original way to write tengwar. Support for the other modes described by Tolkien is planned for a future version.

## 2. How to use

### 2.1. Requirements

- [Typst](#) version 1.11.1 or up
- The [Tengwar Annatar](#) fonts version 1.20 (support for other Tengwar fonts is not currently planned.)

### 2.2. Importing the module

To import the module, simply add

```
#set align(center)
#text(size: 16pt,
      fill: gradient.linear(blue, green)
)[#box(kenya[_tengwar_])]
]
```

## 2.4. Quenya (ᑦᑭᑦ)

### 2.4.1. Generalities

The implementation of the Quenya mode follows Reference [3], summarizing information available in Appendix E of [2] and examples provided in other parts of the book. Here are a few basic examples:

quenya[quenya] 

quenya[quetta] 

quenya[tengwar]

quenya[namárië] 

A full description of the Quenya mode is beyond the scope of this document. As a first approximation, consonant sounds are represented by *tengwar* as follows:

consonant	tengwa	consonant	tengwa	consonant	tengwa	consonant	tengwa
t	ᵀ	p	ᵇ	c	ᶜ	cw	ᶜᵂ
nd	ᵇᵇ	mb	ᵇᵇ	ng	ᶜᶑ	ngw	ᶜᶑᵂ
s	ᶜ	f	ᶜ	h	ᶜᵃ	hw	ᶜᶜᵃ
nt	ᵇᵇ	mp	ᵇᵇ	nc	ᶜᶜᶜ	ncw	ᶜᶜᶜᵂ
n	ᵇᵇ	m	ᵇᵇ	n	ᵇᵇ	nw	ᵇᵇᵂ
r	ᵇᵇ	v	ᵇᵇ	y	ᶜᵃ	w	ᵇᵇ

consonant	tengwa
rd	ᶜᶜᶜ
l	ᶜᶜᶜ
ld	ᶜᶜᶜ
ss	ᶜᶜᶜ

Different tengwar are used for the same sounds in different situations; see Section 2.4.2. Vowel sounds are generally represented by a *tehta*, placed either on the previous consonant or a short carrier for a short vowel, or a long carrier for a long vowel<sup>1</sup>:

vowel	short version	long version
a	ä	å

<sup>1</sup>We use an acute accent to denote long vowels. For instance, a is rendered as  $\acute{a}$  and à as  $\grave{a}$ .

vowel	short version	long version
e	í	ǵ
i	î	ǰ
o	ǫ	ǭ
u	û	Ǯ

Diphthongs of the form *-i* and *-u* are obtained by adding a theta to an ‘i-glide’ or ‘u-glide’ symbol:

ai	oi	ui	au	eu	iu
Ǻ	ǻ	Ǽ	Ǿ	ǿ	ǽ

#### 2.4.2. Substitution rules

The equivalences mentioned in Section 2.4.1 should give a correct phonetic transcription from the Latin alphabet to tengwar in the Quenya mode. This does not mean, however, that the spelling is correct. Further substitution rules are required for that; see for instance Reference [3].

- As briefly mentioned above, a short vowel sound following a consonant sound is written as a tehta on the latter. For instance, *númen* (*west*) is written *ṇṽṁṇ*, with *ṁ* replacing *ṁí*. This does not apply to long vowels, the second consecutive vowel after a consonant, or (obviously) to a vowel sound at the start of a word.
- If *ṇ* is followed by a vowel or *y* and a vowel, it is replaced by *ȳ*.
- If *ṽ* follows a consonant, it is replaced by two dots under the corresponding tengwa.
- If a single *Ǯ* follows a consonant, it is replaced by an ‘s-hook’: for instance, *pǮ* → *pǮ̣*.
- If *Ǯ* is followed by a short vowel, it is reversed: *Ǯí* → *ǰ̇*.
- If *Ǯ* is followed by a short vowel, it is reversed: *Ǯǫ* → *ǭ̇*.
- If *λ* is part of the consonant cluster *hl* or *hr*, it is written with a vertical bar as in *hrívē* (*winter*): *ȝjǮ̣*.
- If *λ* is not part of the consonant cluster *hl* or *hr*, nor at the start of a word, it is replaced by *ḏ*.
- Two successive identical tengwar with no tehta on the first one are replaced by a single tengwa with a wavy line under it. For instance, the word *anna* (*gift*) is written *ṇṽṁ*, with *ṽ* replacing two *ṇs*. Similarly, in *ǵjǮ̣* (*quetta*), *p̣* replaces two *p̣s*.

#### 2.4.3. Capital letters

There is, as far as I am aware, no standard way to write capital letters in Tengwar. One possible option is to use bold to denote a capital letter:

quenya[#strong[Va]lmar] **ṇṽṁ**

#### 2.4.4. Punctuation

The module provides the following punctuation symbols:

input	,	.	-	—	!	?	(	)	/
output	·	:	~	~	ǵ	Ḃ	(	)	ȝ

**Note:** Generally, parentheses in Quenya are denoted by the single symbol *ȝ*—there is no distinction between opening and closing parentheses. We deviate from this convention by mapping the symbol ‘(’ to ‘(’ and ‘)’ to ‘)’. The proper Tengwar parenthesis is mapped to ‘/’.

quenya[.-] ~ quenya[.,] ∴ quenya[.] ∷ quenya[,.,] ∴

quenya[»quenya«] 

quenya[nn n:n]  quenya[na n:a] 

0	1	2	3	4	5	6	7	8	9	10	11
๐	๑	๒	๓	๔	๕	๖	๗	๘	๙	๑๐	๑๑

quenya[1] ᚱ    quenya[11] ᚲ    quenya[12] ᚷ    quenya[100] ᚲᚰ    quenya[123] ᚾᚿ

quenya[144] ᚻᚾ    quenya[1000] ᚲᚶᚦ    quenya[10000] ᚲᚦᚵᚦ    quenya[65537] ᚦᚦᚸᚾ

#### 2.4.6. Example: Namárië

One of the most famous texts written in Quenya is the poem *Namárië* (நம்மர்யீ), originally written in Reference [2]<sup>2</sup> and available for instance in Reference [4]. Below we show the same text without (left) and with (right) the `#show: quenya` command. We use a spacing between line of 0.7em to clearly separate them (some tengwar have a relatively large vertical extension).

##### Namárië

Ai! laurië lantar lassí súrinen,  
yéni únótimë ve rámar aldaron!  
Yéni ve lintë yuldar avánier  
mi oromardi lisse-miruvóreva  
Andúnë pella, Vardo tellumar  
nu luini yassen tintilar i eleni  
ómaryo airetári-lírinen.  
  
Sí man i yulma nin enquantuva?  
An sí Tintallë Varda Oiolossëo  
ve fanyar máryat Elentári ortanë,  
ar ilyë tier undulávë lumbulë,  
ar sindanóriello caita mornië  
i falmalinnar imbë met, ar hísië  
untúpa Calaciryo míri oialë.  
Sí vanwa ná, Rómello vanwa, Valimar!  
Namárië! Nai hiruvalyë Valimar.  
Nai elyë hiruva. Namárië!

##### நம்மர்யீ

ஈ! டௌ்ரீ ட்லாந ட்ரீ ஸ்ரீனெ.  
யீனி உனோதிமெ வெ ராமா அலடாரு!  
யீனி வெ லிந்தெ யுலடா அவானீர்  
மி ஓரொமார்டி லிஸ்செ-மிருவோர்வா  
அநுனெ பல்லா, வார்டு தெல்லுமா  
நு லுனி யாஸ்செ திந்திலா இ எலெனி  
ஓமாயோ அரீதாரி-லீரினெ.  
  
சீ மாந இ யுலமா நின் என்குவா?  
அந சீ திந்தல்லெ வார்டா ஓயோஸ்சே  
வெ ஫ாநயா மார்யாத் எலெந்தாரி ஓர்தானெ,  
அர் இல்யெ தீர் உந்டுலாவெ லும்புலெ,  
அர் சிந்தானோரீல்லெ கைதா மொநீ  
இ ஫ால்மாலின்னார் இம்பெ மெத், அர் ஹீசீ  
உந்தூபா காலாசிரியோ மீரி ஓயாலெ.  
சீ வானுவா நா, ரோமெல்லோ வானுவா, வாலிமா!  
நாமாரீ! நாய் ஹிருவால்யெ வாலிமா.  
நாய் எல்யெ ஹிருவா. நாமாரீ!

<sup>2</sup>Book 2, ch. 8 “Farewell to Lórien”

## 2.5. The One Ring inscription

Although the Black Speech is not implemented yet, the One Ring inscription can be reproduced using the Quenya mode as follows:<sup>3</sup>

```
quenya[
  _>Ka:nssangw:ndfrombtaflofkwô, Ka:nssangw:ngwmbetalô«
  #linebreak()#v(0.7em)
  Ka:nssangw:sfrquataflofkwô, fNgwa:mbfrossmokii:qufrpetalo_
]
```

Obviously, that's not quite how the ring inscription is supposed to sound. One reason is simply that the Quenya and Black Speech modes have different relations between symbols and sounds: to obtain the same written result, one has to 'transcribe' the phonetic description to how it would be read in the Quenya mode. Another difference is that some of the tengwa forms used in the ring inscription are generally not used in Quenya; we thus use the symbol £ to get variants. We also use £ to switch between *ṛ* and *ṡ*. Finally, words are separated with : to avoid repeated consonants being combined. Here is the result, with a colour gradient in the background to mimic a golden surface and on the text to represent incandescence:

The full code for the above example is:

```
#let ring-inscr-quenya = "
  _>Ka:nssangw:ndfrombtaflofkwô, Ka:nssangw:ngwmbetalô«
  #linebreak()#v(0.7em)
  Ka:nssangw:sfrquataflofkwô, fNgwa:mbfrossmokii:qufrpetalo_
"
#set text(top-edge: "ascender", bottom-edge: "descender",
  fill: gradient.linear(rgb(150,0,0), rgb(100,20,0), rgb(255,0,0), space: rgb, angle:
20deg))
#align(center, block(
  fill: gradient.linear(rgb(157,103,7), rgb(250,250,152), rgb(157,103,7), space: rgb, angle:
80deg),
  inset: (top: 1em, left: 1em, right: 1em, bottom: 1.5em),
  radius: 5pt,
  quenya(eval(ring-inscr-quenya, mode: "markup"))))
```

<sup>3</sup>This is obviously a bit of a hack, meant only to show how the limitations of having only one mode implemented can be circumvented. This example is not supposed to be stable and might render differently in a later version.

### 3. Math mode?

Use of tengwar in math mode is not fully supported, although it should work in simple cases. In math mode, you'll need to apply the conversion function to each part of a formula you want to write in Tengwar, which can be made slightly less cumbersome by redefining it to a shorter command:

```
#let q = quenya
$
integral_#q[0]^#q[2] #q[t]^#q[3] upright(d)#q[t]
= [ #q[t]^#q[4] / #q[4] ]_#q[0]^#q[2]
= #q[2]^#q[4] / #q[4]
= #q[16] / #q[4]
= #q[4]
$
#v(1em)
$
#q[t] :
mat(delim: "(",
  RR & -> RR ;
  #q[a] & |-> #q[a]^#q[123])
=>
(upright(d)#q[t]lr((#q[a]))) / (upright(d)#q[a]) = #q[123 a]^#q[122]
$
```

$$\int_{\circ}^{\varpi} p^{\varpi} dp = \left[ \frac{p^{\circ}}{\circ} \right]_{\circ}^{\varpi} = \frac{\varpi^{\circ}}{\circ} = \frac{\circ^{\tau}}{\circ} = \circ$$

$$p : \left( \begin{array}{c} \mathbb{R} \rightarrow \mathbb{R} \\ \dot{\mathfrak{p}} \mapsto \dot{\mathfrak{p}}^{\varpi\delta} \end{array} \right) \Rightarrow \frac{dp(\dot{\mathfrak{p}})}{d\dot{\mathfrak{p}}} = \varpi\delta \dot{\mathfrak{p}}^{\varpi\delta}$$

Writing math-heavy content in tengwar would probably require a specific module, though, as well as a different tengwar font designed for this purpose (or a math font designed to work well with a tengwar font).

### 4. How to contribute

Any kind of contribution is warmly welcome! Here are a few ways you can help:

- **Bug reports:** Some text rendering incorrectly in Tengwar? Unexpected formatting? Any other issue with the code or documentation? Please report it! This module was only tested on a very small corpus so far, and identifying any corner case where it does not work as intended is very useful!
- **References:** There is a lot of content available, both online and in printed books and magazines, about the languages invented by Tolkien, how they relate to his works, and their relevance in today's cultural fabric. I am unfortunately not very familiar with them; but if you know good references please let me know and I'll cite them.
- **Language help:** My knowledge of Tengwar and the languages invented by J. R. R. Tolkien is quite superficial, and I may well have missed or misunderstood some of the rules for writing in Tengwar. If you spot anything that looks wrong, please let me know!
- **Implementation:** The Typst code is likely not quite as efficient nor as clean as it could be. If you can see better ways to implement something, please feel free to let me know or to submit a pull request with an improved version!
- **Feature requests:** Any feature request is welcome. I can't promise I'll have the time and knowledge to implement everything that would be nice to have; but if you'd like to see something implemented please let me know—or submit a pull request if you've already implemented it!
